

AI-POWERED DATA ANALYSIS REPORT

AI in Education: Bridging India's Learning Gap

Yash Raj Goswami | InAmigos Foundation Internship - Task 2 | June 2026

Overview

Artificial Intelligence is rapidly transforming how students learn, both globally and in India. This report uses AI tools to research and summarize current trends, statistics, and challenges in AI-driven education, with a focus on India's opportunities and gaps.

92%

Students Using AI (2025)

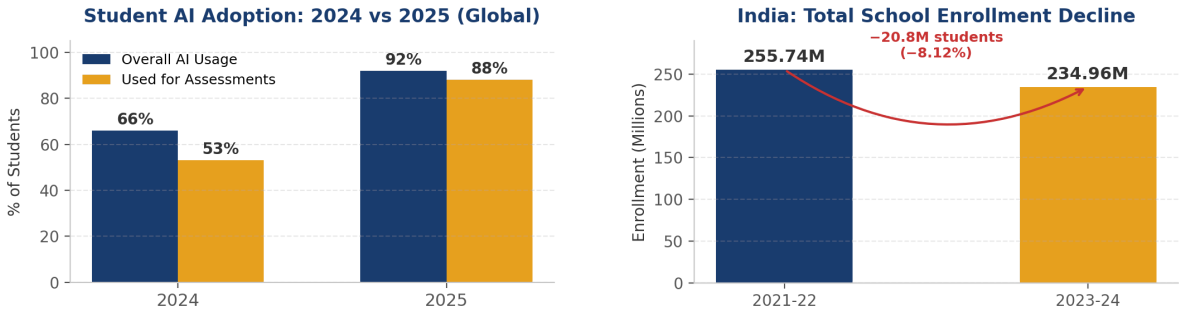

74%

Indians Optimistic on AI

47.4M

Children Out of School (India)

Data Snapshot

Left: Global student AI adoption nearly doubled key metrics within a year. Right: Despite rising AI optimism, India's total school enrollment fell by 20.8 million (8.12%) between 2021-22 and 2023-24, with secondary dropout at 14.1%.

Key Findings

- Global student AI usage rose from 66% (2024) to 92% (2025); a 2025 Harvard study found AI-tutored students learned 2x faster than in traditional classrooms
- India leads the world in daily Gemini usage for learning, and 74% of Indians believe AI will improve student outcomes (Google-Ipsos survey)
- Despite optimism, India faces a 14.1% secondary dropout rate and 47.4 million out-of-school children - concentrated among SC, ST, and Muslim communities
- A 2024 PNAS Nexus study warns AI could widen socioeconomic gaps without inclusive policy, since high-income regions dominate AI development
- Rural students cite unreliable internet and limited device access as key barriers (UNICEF India, Dec 2024)

Challenges vs. Opportunities

Challenges	Opportunities
Rural digital divide & device access	Wadhvani AI: adaptive learning for 75M students
14.1% secondary dropout rate	YUVAi: AI literacy for ages 8-12
Lack of AI literacy among teachers	AI tutors improving learning speed 2x

Conclusion

AI offers India a powerful lever to personalize learning and re-engage at-risk students, but its benefits will only reach the students who need them most if rural infrastructure, teacher training, and inclusive policy keep pace with adoption. This report itself was researched and structured using AI tools (Claude by Anthropic), demonstrating how AI can accelerate research and insight generation.
